C;Species: Clostridium perfringens
C;Species: Clostridium perfringens
C;Accession: T43863
R;Koyama, M.
Submitted to the EMBL Data Library, August 1998
A;Description: Clostridium perfringens hem operon.
A;Reference number: Z22707
A;Accession: T43863
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: DNA
A;Residues: 1-476 <KOX>

G97556
hypothetical 55.9K protein in csgc-mdog intergenic region [imported] - Agrobacterium tum
C; Species: Agrobacterium tumefaciens
C; Date: 30-Sep-2001 #sequence_revision 30-Sep-2001 #text_change 09-Jul-2004
C; Accession: G97556

RESULT 1

The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76716-ABP81046 represent nucleic acid molecules of the invention New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection. Antibacterial; infection; vaccine; gene therapy N. gonorrhoeae amino acid sequence SEQ ID 5462. ы :-Monaci Disclosure; Page 587; 815pp; English.                                                                                                                                                                              The present sequence represents a p55 polypeptide. The specification describes p177, p88, p64, p55 and p46 polypeptides from Neisseria gonorrheae. The polypeptides are useful as vaccines, for preventing, protecting a female patient against, N. gonorrheae colonization or inflection. Such immunisation can prevent gonorrhea in women. AAZS4571 to AAZS4576 and AAZS4616 to AAZS5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, a sidagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial

                                                                                                                                                                                                                                         ò
                                                                                                                                                                                                                                                                       셤
                                                                                                                                                                                                                                                                                                                                                                               AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 and polypeptides. AAZ54577 to AAZ54576 and AAZ54616 to AAZ55471 represent and polypeptides. AAZ54572 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the prosticion can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polypurcleotides of the invention may also be used in gene therapy protocols. (Updated on 12-SEP-2003 to standardise OS

bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also used in gene therapy protocols

AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynuclectides and polypeptides. AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynuclectides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynuclectides of the invention may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        377

The invention relates to Pseudomonas aeruginosa polypeptides and the polynucleotides encoding them. The sequences are useful in diagnosis and therapy of pathological conditions, as molecular targets for diagnostics, prophylaxis and treatment of pathological conditions resulting from a barching to bind a P. aeruginosa mucleic acid, as components of effective antibacterial targets, as targets for antibacterial drugs, including anti-P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa drugs, as templates for recombinant production of P. aeruginosa sequences or polypeptides, as target components for diagnosis and/or treatment of P. aeruginosa sequences of Pseudomonas species using biochip technology. Sequences AB067826. The Reduction of P. aeruginosa sequences or other sequences of Pseudomonas species using biochip technology. Sequences AB067826. Sequence data for this patent did not form part of the printed sequence than sequence trom of the printed sequence. The sequence than a sequence them
